# The problem with clock()

## ❑ clock() function behaviour

- ❑ In windows: represents a measure of real time (wall clock time)

- ❑ Linux: represents a cumulative measure of time spent executing instructions

  - ❑ Cumulative over core = not good for measuring parallel performance

## ❑ Open MP timing

- ❑ omp\_get\_wtime() – cr

<https://eduassistpro.github.io/>

Add WeChat edu\_assist\_pro

```
double begin, end, seconds;  
begin = omp_get_wtime();  
  
some_function();  
  
end = omp_get_wtime();  
seconds = (end - begin);  
  
printf("Sum Time was %.2f seconds\n", seconds);
```

Add WeChat edu\_assist\_pro

# Parallel Reduction

❑ A Reduction is the combination of local copies of a variable into a single copy

❑ Consider a case where we want to sum the values of a function operating on a vector of values;

Assignment Project Exam Help

```
void main() {  
    int i;  
    float vector[N];  
    float sum;  
  
    init_vector_values(vector);  
    sum = 0;  
  
    for (i = 0; i < N; i++) {  
        float v = some_func(vector[i]);  
        sum += v;  
    }  
    printf("Sum of values is %f\n", sum);  
}
```

<https://eduassistpro.github.io/>

Add WeChat edu\_assist\_pro

Candidate for  
parallel  
reduction...

# NBody calculation with OpenMP

```
void main(){
    int i;
    float vector[N];
    float sum;

    init_vector_values(vector);
    sum = 0;

    #pragma omp parallel for reduction(+: sum);
    for (i = 0; i < N; i++){
        float v = some_func(vector[i]);
        sum += v;
    }
    printf("Sum of values is %f\n", sum);
}
```

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu\_assist\_pro

Without reduction  
we would need a  
critical section to  
update the shared  
variable!

# OpenMP Reduction

- ❑ Reduction is supported with the reduction clause which requires a reduction variable
  - ❑ E.g. `#pragma omp parallel reduction(+: sum_variable) {...}`
  - ❑ Reduction variable is implicitly private to other threads
- ❑ OpenMP implements this by;
  - ❑ Creating a local (private) reduction variable
  - ❑ Combining local copies of the structured block
  - ❑ Saving the reduced value to the shared variable master thread.
- ❑ Reduction operators are `+`, `-`, `*`, `&`, `|`,
  - ❑ `&`: bitwise and
  - ❑ `|`: bitwise or
  - ❑ `&&`: logical and
  - ❑ `||`: logical or

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu\_assist\_pro

# Scheduling

- ❑ OpenMP by default uses static scheduling
  - ❑ Static: schedule is determined at compile time
  - ❑ E.g. `#pragma omp parallel for schedule(static)`
- ❑ In general: `schedule(type [, chunk size])`
  - ❑ `type=static`: iterations are assigned before execution (preferably at compile time)
  - ❑ `type=dynamic`: iterations are assigned as they become available
  - ❑ `type=guided`: iterations are assigned as they become available (with reducing chunk size)
  - ❑ `type=auto`: compiler and runtime determine the schedule
  - ❑ `type=runtime`: schedule is determined at runtime

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu\_assist\_pro

What would be a use case where static scheduling is a bad choice?

# Static scheduling chunk size

## ❑ chunk size

- ❑ Refers to the amount of work assigned to each thread
- ❑ By default chunk size is to divide the work by the number of threads
  - ❑ Low overhead (no going back for more work)
  - ❑ Not good for uneven workloads
  - ❑ E.g. consider our last l updated to use reduction)

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu\_assist\_pro

```
int n;  
double result = 0.0;  
double x = 1.0;  
  
#pragma omp parallel for reduction(-: result)  
for (n = 0; n < EXPANSION_STEPS; n++){  
    double r = pow(-1, n - 1) * pow(x, 2 * n - 1) / fac(2 * n);  
    result -= r;  
}  
  
printf("Approximation is %f, value is %f\n", result, cos(x));
```

Uneven workload

# Scheduling Workload

```
long long int factorial(int n)
{
    if (n == 0)
        return 1;
    else
        return (n * factorial(n - 1));
}
```

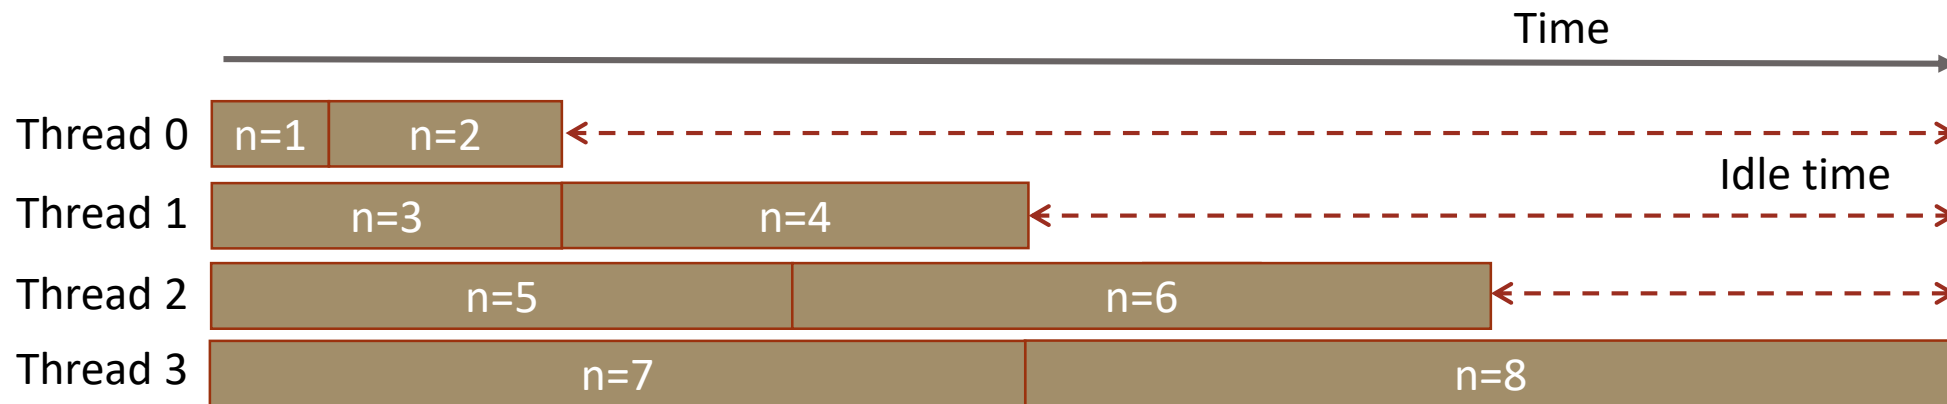

Assignment Project Exam Help

❑ Uneven workload among threads <https://eduassistpro.github.io/>

❑ Increase in  $n$  leads to increased computation time

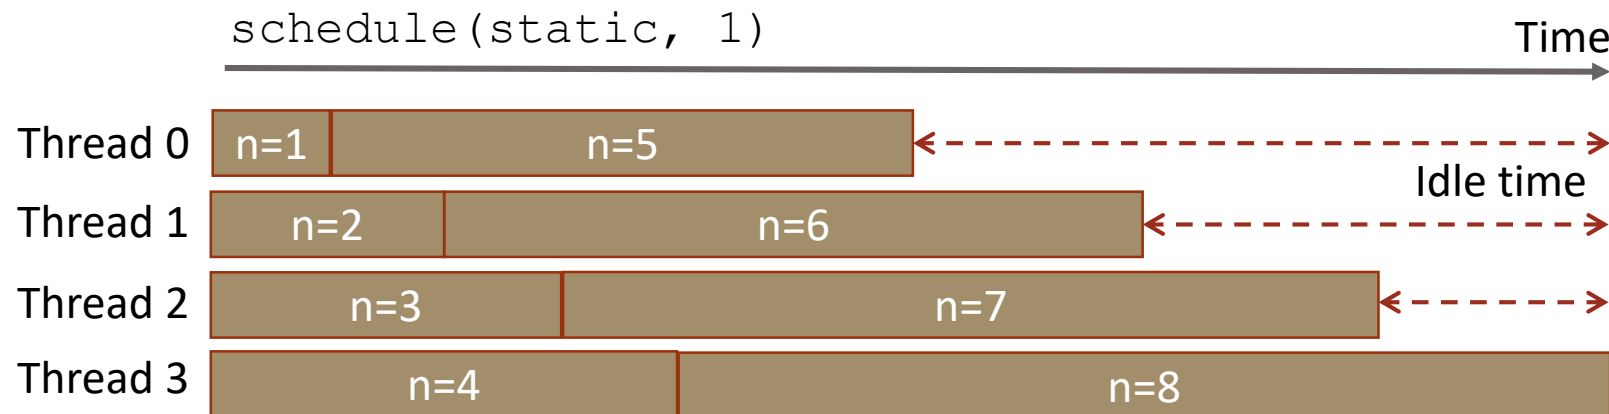

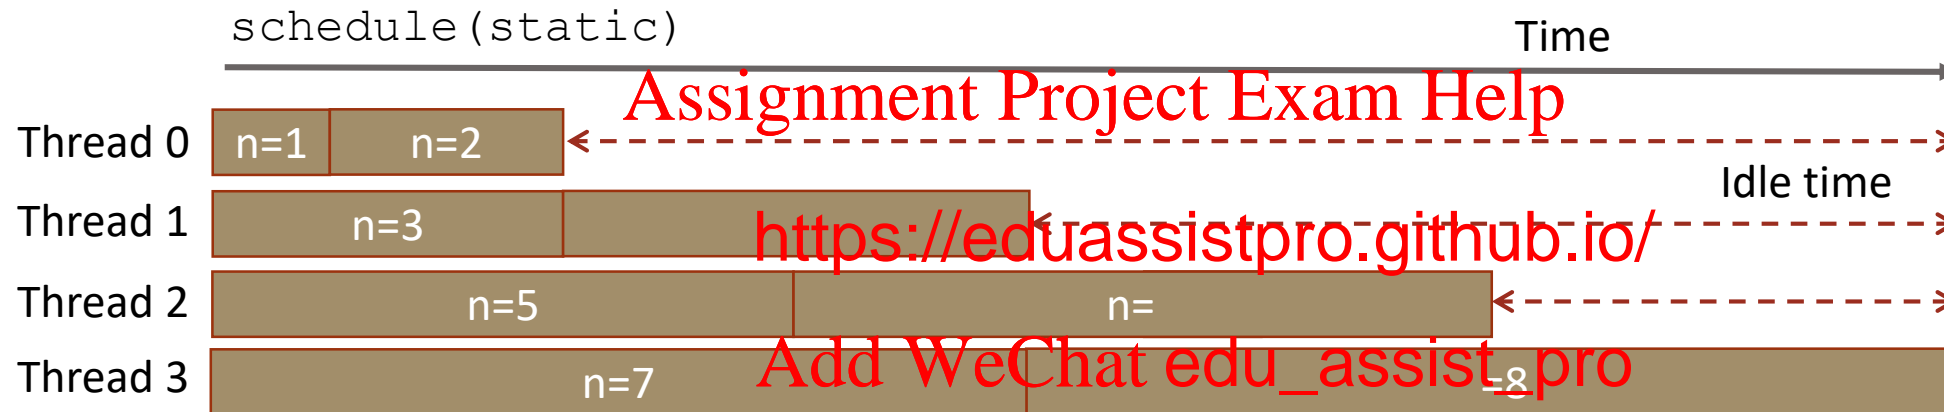

❑ E.g. `EXPANSION_STEPS=8; num_threads=4; schedule(static)`

Add WeChat edu\_assist\_pro

# Cyclic Scheduling

- ❑ It would be better to partition the workload more evenly
  - ❑ E.g. Cyclic scheduling via chunk size

# Cyclic Scheduling

```
#pragma omp for num_threads(4)
for (i = 0; i < 16; i++)
```

`schedule(static, 1)` `schedule(static, 2)` `schedule(static, 4)`

|          |   |   |    |    |
|----------|---|---|----|----|
| Thread 0 | 0 | 4 | 8  | 12 |
| Thread 1 | 1 | 5 | 9  | 13 |
| Thread 2 | 2 | 6 | 10 | 14 |
| Thread 3 | 3 | 7 | 11 | 15 |

<https://eduassistpro.github.io/>

Add WeChat edu\_assist\_pro

|          |   |   |    |    |
|----------|---|---|----|----|
| Thread 0 |   |   |    |    |
| Thread 1 |   |   |    |    |
| Thread 2 | 4 | 5 |    |    |
| Thread 3 | 6 | 7 | 14 | 15 |

|          |    |    |    |    |
|----------|----|----|----|----|
| Thread 0 | 0  | 1  | 2  | 3  |
| Thread 1 | 4  | 5  | 6  | 7  |
| Thread 2 | 8  | 9  | 10 | 11 |
| Thread 3 | 12 | 13 | 14 | 15 |

*Default case*

❑ Default chunk size is  $n/\text{threads}$

❑ where  $n$  is the number of iterations

# Dynamic and Guided Scheduling

## ☐ Dynamic (med overhead)

- ☐ Iterations are broken down by chunk size

- ☐ Threads request chunks of work from a runtime queue when they are free

- ☐ Default chunk size is 1

## ☐ Guided (high overhead)

- ☐ Chunks of the workload

- ☐ Threads request chunks

- ☐ Chunk size is the size which the workload

- ☐ with the exception of last chunk which may

## ☐ Both

- ☐ Requesting work dynamically creates overhead

- ☐ Not well suited if iterations are balanced

- ☐ Overhead vs. imbalance: How do I decide which is best?

- ☐ Benchmark all to find the best solution

Add WeChat edu\_assist\_pro

- ❑ What if OUTER\_LOOPS << number of threads
- ❑ E.g. OUTER\_LOOPS = 2

# Nesting

## ❑ We can use parallel nesting

- ❑ Nesting is turned off by default so we must use `omp_set_nested()`
- ❑ When inner loop is met each outer thread creates a new team of threads
- ❑ Allows us to expose higher levels of parallelism
- ❑ *Only useful when oute*

```
omp_set_nested(1);
```

```
#define OUTER_LOOPS 2
```

```
#define INNER_LOOPS 4
```

```
#pragma omp parallel for
```

```
for (i = 0; i < OUTER_LOOPS; i++){
```

```
    int outer_thread = omp_get_thread_num();
```

```
    #pragma omp parallel for
```

```
        for (j = 0; j < INNER_LOOPS; j++){
```

```
            int inner_thread = omp_get_thread_num();
```

```
            printf("Hello World (i T=%d j T=%d)\n", outer_thread, inner_thread);
```

```
        }
```

```
    }
```

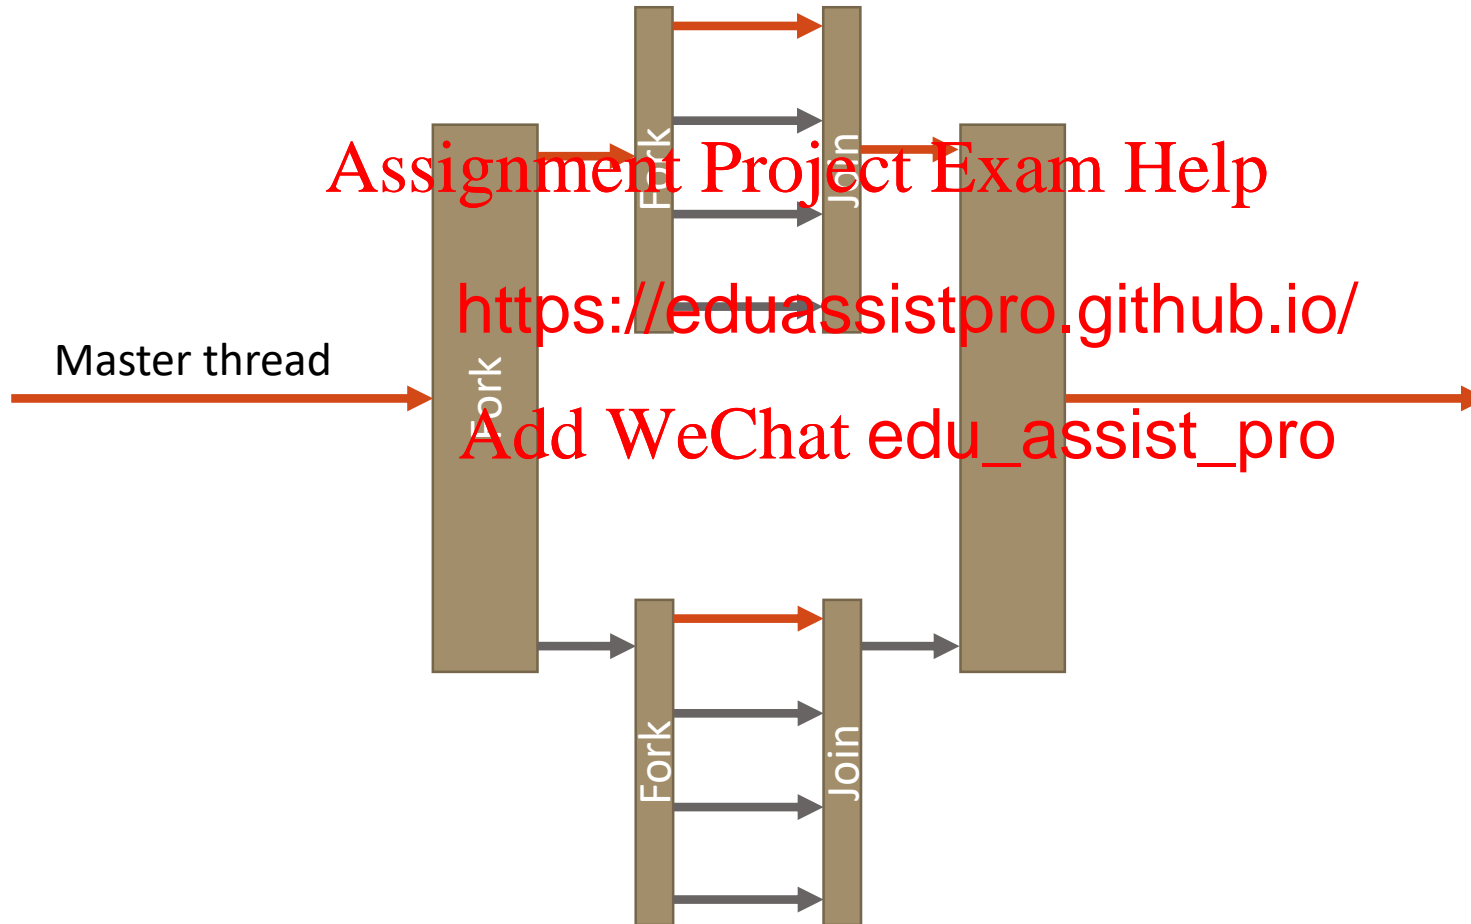

<https://eduassistpro.github.io/>

Add WeChat edu\_assist\_pro

```
Hello World (i T=0 j T=0)
Hello World (i T=0 j T=1)
Hello World (i T=0 j T=3)
Hello World (i T=1 j T=2)
Hello World (i T=1 j T=1)
Hello World (i T=1 j T=0)
Hello World (i T=0 j T=2)
Hello World (i T=1 j T=3)
```

# Nesting Fork and Join

- ❑ Every parallel directive creates a fork (new team)
  - ❑ In this case each `omp parallel` is used to fork a new parallel region

# Collapse

- ❑ Only available in OpenMP 3.0 and later (**not VS2017**)
- ❑ Can automatically collapse multiple loops
- ❑ Loops must not have statements or expressions between them

```
#pragma omp parallel for collapse(2)
for (i = 0; i < OUTER_LOOPS; i++){
    for (j = 0; j < INNER_LOOPS; j++){
        int thread = omp_get_thread_num();
        printf("Hello World (T=%d)\n", thread);
    }
}
```

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu\_assist\_pro

Work around...

```
#pragma omp parallel for
for (i = 0; i < OUTER_LOOPS* INNER_LOOPS; i++){
    int thread = omp_get_thread_num();
    printf("Hello World (T=%d)\n", thread);
}
```

# Performance

- ❑ Remember ideas for general C performance

  - ❑ Have good data locality (good cache usage)

  - ❑ Combine loops where possible

- ❑ Additional performance criteria

  - ❑ Minimise the use of b

    - ❑ Use `nowait` but only

  - ❑ Minimise critical sections

    - ❑ High overhead. Can you use reduction or

Assignment Project Exam Help

<https://eduassistpro.github.io/>

Add WeChat edu\_assist\_pro

# Summary

- ❑ Parallel reduction is very helpful in combining data
  - ❑ It will use the OS most efficient method to implement the combination
- ❑ Scheduling can be static or dynamic
  - ❑ Static is good for fixed work sizes
  - ❑ Dynamic is good for v
  - ❑ Benchmarking is impo
- ❑ Nested parallelism can improve per for outer loops with poor parallelism
- ❑ To get good performance try to avoid critical sections and barriers
